

POLYDRAIN

A RICHTECH INDUSTRIES PRODUCT

- INCREASES WATER INTO DRAIN SYSTEM
- ELIMINATES SWEATING OF CONCRETE
- HEAVY DUTY CONSTRUCTION GRADE MATERIAL
- ALLOWS THICKER REPLACEMENT FLOOR
- EXCELLENT FOR THIN FLOORS AND HIGH FOOTERS

1' X 100 ROLL: PDI002G
2' X 100 ROLLS: PDI001G

* ROLLS ARE GREY IN COLOR

MADE IN THE USA

Polydrain uses air-gap technology to significantly increase water drainage and replacement of the foundation floor at the original thickness. Polydrain maintains a 5/8" air gap between the footer and the replacement slab. Polydrain is laid directly onto the footer and extends over the drain system. Eliminating gravel on the footer boosts water flow by removing resistance. By extending Polydrain up the wall, the weep holes are protected and any moisture from the foundation wall is channeled into the drainage system. Polydrain is made from Ultra-High Molecular Weight (UHMW) thermoplastic, and can be bent and folded as needed with no cracking.

Polydrain uses Air-Gap Technology to significantly increase water drainage and replacement of the foundation floor at the original thickness.

Polydrain is laid directly onto the footer and extends over the drain system.

Polydrain maintains a 5/8" Air Gap between the footer and the replacement slab.

By extending Polydrain up the wall, the weep holes are protected and any moisture from the foundation wall is channeled into the drainage system.

Eliminating gravel on the footer boosts water flow by removing resistance.

A waterproofing job where Polydrain wasn't used and the concrete replacement floor blocked the weep holes in the wall.

Without Polydrain, moisture can wick through the concrete and condensation puddles will form on the new floor.
